Re:	System Update to Waiting Room Solutions

The WRS Development Team will be performing a software update to the Waiting Room Solutions System on June 05, 2010. The updated version of the system includes the following enhancements and added functionality. These have been designed to improve overall system functionality, security and usability. This update includes the following:

Medications Page Enhancements

- The user can now create and save default text under the Comments field on the Medication Page. This works in the same manner as the Comments section of the Assessment/Plan and Orders/Procedures pages. Pressing the green "Default" button will enable the user to set the text to appear on subsequent selections of the same dosage-form. Note that there is one default comment per dosage form.

- Drug Interactions can now be run at any time, not only at Rx create time.

PQRI E-Prescribing Incentive Codes

Per the updated Medicare PQRI E-Prescribing Incentive Requirements, the following changes were made:

- Added Code **G8553** (1+ prescription transmitted electronically via eRx for the encounter). This replaces Code **G8443** (successful ERx).

- Removed submission of **G8445** and **G8446** – these are no longer being tracked by Medicare.

Miscellaneous Enhancements & Adjustments

Several enhancements and adjustments have been made to overall system functionality. These include, but are not limited to, the following:

- Cloning of EMR customized dropdown list added to EMR Clone tool
- Summary of Health records has been updated to include Social History Information
- "10-Minute" increment added to Create New Schedule Setup Grid
- "Every 3 Weeks" added as recurrence type to Create New Schedule Options
